

# ENHANCED HUMAN

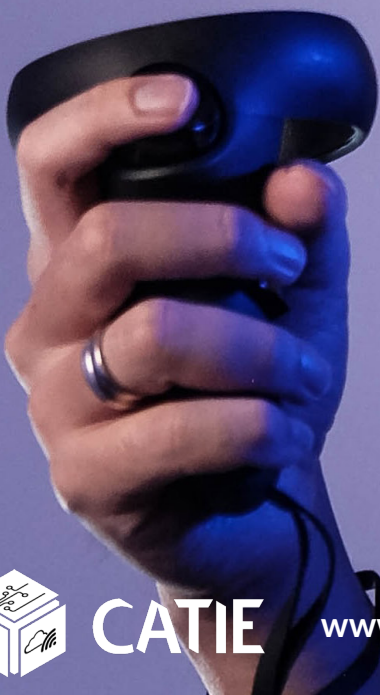

Prepare tomorrow

The enhanced Human can be defined by improving Human capacities thanks to electronic systems.

The analysis of Human behavior and the physiological monitoring data allow the design of electronic enhanced systems that improve motor, physiological and cognitive performances of Users.

The interaction and collaboration between Human and the machine (or the robot) can be done via different technological supports such as Virtual Reality, Augmented Reality or Mixed Reality, connected watches, etc.

*Use cases: voice recognition, sports training, industry 4.0, autonomous vehicle, robotics...*

OUR EXPERTS DESIGN EMBEDDED SYSTEMS  
ADAPTED TO THE **USERS'** ENVIRONMENT  
AND THEIR CHARACTERISTICS
